

Healthcare Analytics Assessment

"Empower your organization by utilizing data and analytics to make strategic decisions and optimize efficiencies."

The right healthcare analytics solution whether it be on premise or in the cloud is the answer to your data questions and problems in order to reduce operational, financial, and revenue cycle costs while providing optimal patient healthcare and patient security.

Even with EMR and non-EMR data in hand, our clients have found that there is no easy way to measure and understand if you have the processes, technology and staff in place to effectively create and use analytics to assist in your providing quality care while reducing costs of care delivery.

brij understands that you are running a large complex provider organization and although analytics may be a necessity, it is not your only priority. brij will partner with you by providing an assessment that highlights your organization's analytics maturity, provider ambitions, and work together to align your organization to your analytics objectives.

Assessment Areas

- Organizational goals and strategic objectives
- Technology: investments in place, tolerance for change, IT policies and constraints
- Data: sources, sharing, governance
- Analytics: Current operational and clinical analytics in place
- Staff: utilization, satisfaction, organization, support/buy-in

After the assessment, our analytics experts will sit down with you and discuss your goals and current analytics state. Recommendations may include improving your organization's analytics maturity with data transparency and data consolidation, supplemental technology, staff augmentation, training or analytics goals to consider for the future

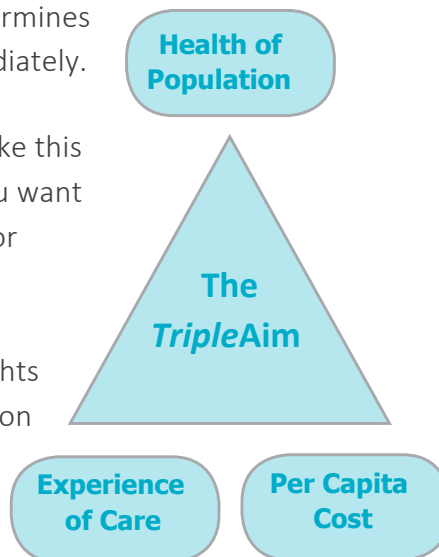

Healthcare Analytics Assessments

Healthcare is focused on the Triple Aim – improving the patient experience of care, improving the health of populations and reducing the per capita cost of health care. The Triple Aim is an ambitious goal and advanced analytics can be your key to unlock the information needed to achieve success.

Our Performance Improvement Assessment determines where your organization is today and determines fundamental areas to be successful immediately.

Our Advanced Analytics Assessment will take this one step further and determine where you want to be with a focus on an analytic culture for both operational and clinical measures. Advanced analytics such as predictive and prescriptive analytics provide deeper insights into improving the health of your population and optimizing operations to decrease costs which both affect patient satisfaction.

The achievement of the Triple Aim cannot be achieved by focusing on just one area of improvement. The three initiatives are closely coupled and need to be approached cohesively to be successful. Making advances in your analytic culture will help your bottom line but also impact the health of the community you serve and allow you to react quicker to the constant evolution in healthcare.

Performance Improvement

Our experts will look at specific areas in the organization where performance improvements could improve efficiencies and costs.

The Assessment Will Provide:

Prioritized guidance on the key performance indicators to be implement and estimated return on investment (ROI) for these analytics. Areas of assessment include:

- **Staffing**
- **Buyer/Supplier**
- **Financial**
- **Inventory**

Improve performance by putting data and analytics into the hands of your organization's decision makers.

“40% of major decisions are based not on facts, but on the manager’s gut”

~Analytics at Work
