

NEW

KNOCKOUT VOLTAGE TEST STATION KIT

The Voltage Test Station

(VTS) has been making absence of

voltage testing safer and more productive for years, and

now a new design is available for installation. The new Knockout

VTS kit ships with a detailed, magnetic installation template. Simply mount the

template onto the desired location of installation and mark your knockouts. The

VTS is then installed through two 30mm knockouts with the housing mounted

through four bolted connections. The Knockout VTS kit also makes it possible to

install a VTS on top of an existing Safe-Test Point™ or R-3W series voltage indicator

with ease.

Absence of Voltage Testing has never been safer and easier to perform with the VTS.

Simply insert your metered probes into the high impedance test points and measure

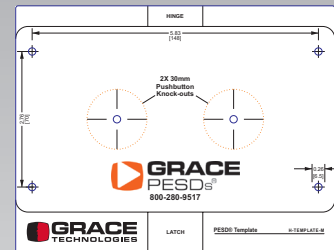

from line-to-line and line-to-ground to take a reading. The LED voltage indicators will

illuminate when voltage is present and will also help diagnose leg loss and

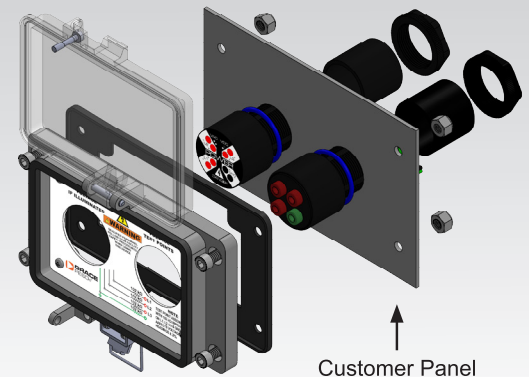

stuck blade scenarios.
