

# Secure Access to Corporate Systems with Hysolate

---

## The Challenge

Secure access to sensitive corporate systems and data is amongst the highest priorities for IT and Security teams, as these are the holy grails for attackers and cyber security criminals. While corporations have invested millions to ensure that access to these systems and data is done securely through the use of Identity and Access Management (IAM), Privileged Access Management (PAM) and and more recently, conditional access and Zero Trust approaches, the threat of accessing these systems from a compromised device continues to pose a significant risk to corporations.

Some organizations have gone to the extreme of providing their privileged users with an additional device solely for the purpose of accessing sensitive systems and data and others are actively seeking methods to ensure that access to such systems is performed from a sterile and trusted environment.

---

## The Solution

IT and Security teams can provide corporate users with an isolated workspace that runs on the user's endpoint device, so they can access sensitive systems and data from a completely isolated and secure environment.

Hysolate is installed on user endpoints, but managed from the cloud, so you can quickly and easily deploy it and scale it across your company, customizing settings for each team and their needs. Hysolate provides a native Windows experience, with minimal lag and latency issues and is cost effective, due to the fact that the isolated OS is running on the user's device and not as a dedicated workload in the cloud.

# Benefits

/1

Users can access sensitive systems and data from a highly locked down and restricted environment

/2

Limit network connectivity from the Workspace only to the sensitive systems

/3

Prevent transfer of files or other clipboard data from the Workspace to the less restricted corporate OS

/4

Prevent screen and keyboard capturing from the corporate OS

# About Hysolate

Hysolate enables organizations to create trusted endpoints that are secure by design. With Hysolate you can isolate endpoint threats and secure enterprise access with an isolated virtual workspace that runs on the endpoint, and is fully managed from the cloud. This secure by design architecture splits the endpoint into two isolated workspaces, providing IT and Security management with peace of mind, without compromising user productivity.

Hysolate is backed by Bessemer Venture Partners, Innovation Endeavors, Team8 and Planven Capital. For more information
