A. Overview

Overview of Protocol

Day 1: Cryopreserved cells are thawed and cultured overnight in the presence of IL-2.

Day 2: **Enrichment** and **Stimulation** of CD4+ and/or CD8+ T cells for 16 hours.

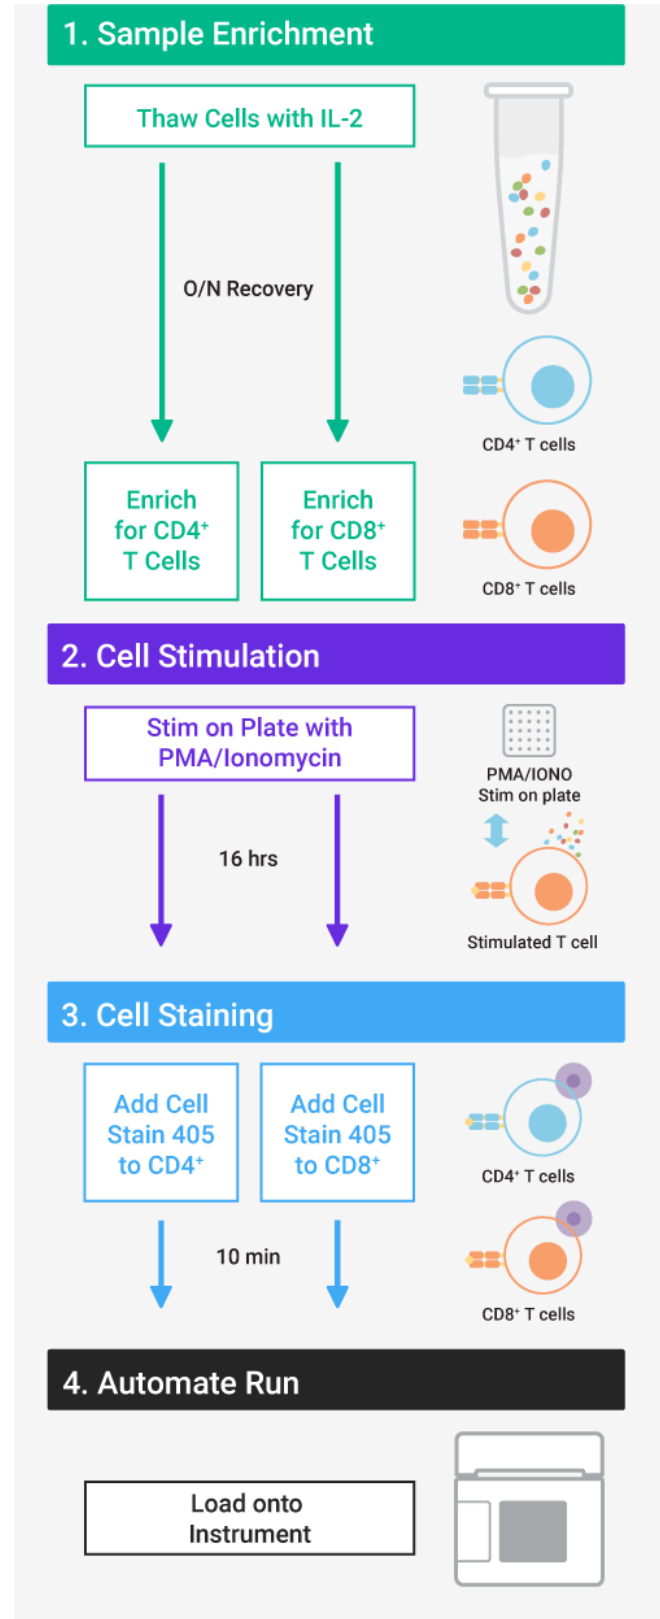

Day 3: **Staining** and Loading of T cells onto IsoCode chip.

NOTE:

This protocol outlines the standard method for thawing and culturing of mouse T cells only and may not be valid for other species or cell types.

NOTE:

Using stains and protocols other than the included kit surface stains and protocols might result in failed runs. Stains and staining procedures not approved by Bruker will require validation prior to use. Please consider Bruker's IsoPACE program to assist in custom marker and protocol validation.

Safety Warnings

- Read MSDS documents of all materials prior to use.
- Laboratory workers should wear standard PPE, including disposable gloves, protective eyewear, and laboratory coats.

Required Reagents, Consumables and Equipment

Table 1: Required Reagents and Consumables Provided by Bruker

| Item | Catalog Number | Quantity | Comment |
|-------------|---|---|---------------------------------------|
| IsoCode Kit | Please see website (https://brukercellularanalysis.com/) for available kits or talk to Bruker's Customer Service team for details | One chip per sample/cell type/condition | Subcomponents stored at 4°C and -20°C |

IsoCode Kit Components

IsoLight IsoCode Reagent Box (4°C)

- 15 mL Tube A
- 15 mL Tube B
- 1.5 mL Tubes A/B: Cocktail A in Micro-Tube (Green Cap) and Cocktail B in Micro-Tube (Red Cap)
- 50 mL Tubes containing Reagents 1, 2, 3, 4, 5, 6, 7, 8
- 1 Bag of Disposable Reagent Sippers

IsoSpark IsoCode Reagent Box (4°C)

- 15 mL Tube A
- 15 mL Tube B
- 1.5 mL Tubes A/B: Cocktail A in Micro-Tube (Green Cap) and Cocktail B in Micro-Tube (Red Cap)
- Cartridge containing Reagents 1, 2, 3, and 4

IsoCode Chip Set (-20°C)

- Boxes of IsoCode Chips (2 per box)
 - IsoSpark: 4 chip kits
 - IsoLight: 4 or 8 chip kits
- Cell Stain 405 [ordered separately]
- Cell Stain 405 Diluent (DMSO) [part of cell stain 405 kit]

Table 2: Required Consumables Not Supplied by Bruker

| Consumable | Type | Source | Catalog Number |
|---|----------------------------------|-------------------|----------------|
| T25 Flask | N/A | Corning | 353108 |
| T75 Flask | N/A | Corning | 430641U |
| 6 Well Plate Flat Bottom | N/A | Corning | 353046 |
| 96 Well Plate Flat Bottom | N/A | Corning | 353072 |
| MACS LS Column | N/A | Miltenyi | 130-042-401 |
| Centrifuge Tubes* | Polypropylene, 15 mL | VWR | CA62406-200 |
| Pipette Tips (Filtered) | 10 µL Graduated Filter Tips | USA Scientific | 1181-3710 |
| | 100 µL Graduated Filter Tips | | 1183-1740 |
| | 1000 µL XL Graduated Filter Tips | | 1182-1730 |
| Serological Pipette | 2 mL Pipette | USA Scientific | 1072-0510 |
| | 5 mL Pipette | | 1075-0110 |
| | 10 mL Pipette | | 1071-0810 |
| Lo-Bind Microcentrifuge Tubes, Sterile | 1.5 mL | USA Scientific | 4043-1081 |
| Syringe with BD Luer-Lok Tip | 10 mL | VWR | 75846-756 |
| 0.2 µm Syringe Filter with Acrylic Housing | N/A | VWR | 28145-501 |
| Fisherbrand Disposable PES Filter Units (0.20 µm) | 500 mL | Fisher Scientific | FB12566504 |

*Bruker strongly recommends that low protein binding centrifuge tubes are used for cell culture work to ensure optimal cell pelleting.

Table 3: Required* Reagents Not Supplied by Bruker

| Reagent | Stock Concentration | Source | Catalog Number |
|--|---------------------|---------------|----------------|
| RPMI | 1x | Fisher | MT10040CV |
| Penicillin-Streptomycin-Neomycin Solution Stabilized | 100x | Sigma | P4083-100mL |
| Glutamax | 100x | Thermo | 35050061 |
| FBS | 1x | Sigma | F2442-6X500mL |
| 2-Mercaptoethanol | 55 mM | Gibco | 21985-023 50mL |
| Recombinant IL-2 | 200 µg/mL | Biolegend | 589104 |
| Bovine Serum Albumin (BSA), lyophilized powder | N/A | Sigma-Aldrich | A9647-10G |
| Phosphate Buffered Saline (1XPBS) without Calcium or Magnesium | 1x | Gibco | 10010072 |
| RoboSep Buffer | 1x | StemCell Tech | 20104 |
| Ficoll Paque PREMIUM 1.084 | N/A | Cytiva | 17544602 |
| Miltenyi CD8a (Ly-2) Microbeads, Mouse, 2 mL | N/A | Miltenyi | 130-117-044 |
| Miltenyi CD4 (L3T4) Microbeads, Mouse, 2 mL | N/A | Miltenyi | 130-117-043 |
| Trypan Blue | 0.4% | Gibco | 15250-061 |
| DMSO (sterile) | N/A | Sigma-Aldrich | D8418-50 ML |
| Ionomycin (lyophilized powder) | N/A | Sigma-Aldrich | I0634-1MG |
| PMA (lyophilized powder) | N/A | Sigma-Aldrich | P8139-1MG |
| Reagent alcohol 70% | N/A | Lab Grade | N/A |

*Reagents have been validated by Bruker and no alternatives may be used.

Table 4: Cell Staining Reagents

| Test Material | Catalog number | Color |
|----------------|----------------|--------|
| Cell Stain 405 | STAIN-1001-1 | Violet |

Table 5: Required Equipment

| Equipment | Source | Catalog Number/Requirements |
|--|----------------------|--|
| IsoLight, IsoSpark, or IsoSpark Duo Instrument | Bruker | ISOLIGHT-1000-1, ISOSPARK-1000-1, or ISOSPARK-1001-1 |
| Culture Hemocytometer | (Fisher) Hauser Levy | 02-671-55A |
| Hemocytometer Cover Glass | (Fisher) Hauser Levy | 02-671-53 |
| MidiMACS Separator | Miltenyi | 130-042-302 |
| MACS MultiStand | Miltenyi | 130-042-303 |

Table 6: General Equipment

| Equipment | Requirements |
|---------------------|--|
| Pipette | P10, P100, P200, P1000 |
| Pipettor | Ability to pipette between 1 and 10 mL |
| Incubator | 37°C, 5% CO ₂ |
| Tabletop Centrifuge | Temperature controlled*; swinging bucket rotor; ability to centrifuge 15mL conical tubes |
| Microcentrifuge | Temperature controlled*; fixed rotor; ability to centrifuge 1.5 mL microcentrifuge tubes |
| Mini centrifuge | Ability to spin micro sample sizes |
| Water Bath | Ability to heat to 37°C |
| Microscope | Inverted light microscope with 10x and 20x objectives |
| Vortex Mixer | Ability to vortex vials and microcentrifuge tubes; adjustable speed |

*Temperature controlled centrifuges are required so that centrifuging steps can be conducted at room temperature without risk of overheating. Temperature on centrifuges should be set to 21°C.

B. Before Getting Started

1. Important Precautions

Read MSDS documents of all materials prior to use.

Working with Biohazardous Reagents

Please refer to your institute's guidelines and obtain proper training to handle potentially biohazardous samples. It is also strongly recommended that any lab personnel handling human samples should be vaccinated against HBV if the individual does not have sufficient HBV antibody titer.

Additional precautions need to be taken when working with samples that potentially contain an EID agent:

1. Laboratory workers should wear standard PPE, including disposable gloves, protective eyewear, and laboratory coats.
2. Any procedure or process that cannot be conducted in the designated EID BSC should be performed while wearing gloves, gown, goggles and a fit tested N-95 mask.
3. Work surfaces should be decontaminated on completion of work with appropriate disinfectants. This includes any surface that potentially comes in contact with the specimen (centrifuge, microscope, etc.).
4. All liquid waste produced in the processes must be treated to a final concentration of 10% bleach prior to disposal.

2. Reagents to Be Prepared Before Starting

Table 7: Complete RPMI Recipe

- **CRITICAL:** Complete RPMI media has been validated for use by Bruker. Using alternative media may result in failed runs. Please contact your Field Application Scientist for additional information.

| Ingredient | Stock Concentration | Final Concentration | Amount for 500 mL | Vendor/Catalog |
|--|---------------------|---------------------|-------------------|----------------------|
| Penicillin-Streptomycin-Neomycin Solution Stabilized | 100x | 1x | 5 mL | Sigma/P4083-100mL |
| Glutamax | 100x | 1x | 5 mL | Thermo/35050061 |
| FBS | 100% | 10% | 50 mL | Sigma/F2442-6X500 mL |
| RPMI | 1x | 1x | 440 mL | Fisher/MT10040CV |

- **CRITICAL:** 2-Mercaptoethanol will be added to media used for all steps except cell staining quench media and final cell suspension volume to be loaded on IsoCode chip. 2-Mercaptoethanol should only be added to media right before use.

Note | Sterile-filter through 0.20 µm filter before use. Store complete RPMI Media at 4°C and warm up to 37°C in water bath prior to use.

Table 8: 1% BSA Recipe

| Ingredient | Stock Concentration | Final Concentration | Amount for 100 mL | Vendor/Catalog |
|--|---------------------|---------------------|-------------------|-------------------------|
| Bovine Serum Albumin (BSA), lyophilized powder | N/A | 1% | 1 g | Sigma-Aldrich/A9647-10G |
| Phosphate Buffered Saline (1XPBS) without Calcium or Magnesium | 1X | 1X | 99 mL initially* | Gibco/10010072 |

*Rotate solution until BSA powder is dissolved and then bring final volume up to 100 mL with 1X PBS.

Table 9: Working Stock of Recombinant IL-2 (1 µg/mL) Recipe

| Ingredient | Stock Concentration | Final Concentration | Amount for 10 mL | Vendor/Catalog |
|-------------------------------------|---------------------|---------------------|------------------|------------------|
| 1% BSA in 1X PBS (sterile filtered) | 1% | 1% | 9.95 mL | Table 8 |
| Recombinant IL-2 | 200 µg/mL | 1 µg/mL | 50 µL | BioLegend/589104 |

Note | Sterile-filter through a 0.2 µm PES filter before use.

- **CRITICAL:** Prepare 200 µL IL-2 aliquots and freeze at -20°C for no longer than 1 month. Aliquots are single use only and are to be thawed immediately prior to their usage. If there is any remaining volume in an aliquot, do not refreeze but discard.

Table 10: Working Stock of Ionomycin (1 mg/mL) Recipe

| Ingredient | Stock Concentration | Final Concentration | Amount for 1 mL | Vendor/Catalog |
|---------------------------------|---------------------|---------------------|-----------------|-------------------------------|
| Ionomycin (lyophilized powder)* | 1 mg | 1 mg/mL | | Sigma-Aldrich/ I0634-1MG |
| DMSO (sterile) | N/A | N/A | 1 mL** | Sigma-Aldrich/ D8418-50 ML |

*Spin Ionomycin tube in a mini centrifuge for 10 seconds to collect the contents at the bottom of the tube.

** Add DMSO to Ionomycin tube. Pipette mix up & down slowly to mix. The Ionomycin should become clear and colorless when fully in solution.

- **CRITICAL:** Prepare 25 μ L Ionomycin working stock aliquots and freeze at -20°C for no longer than 1 month. Aliquots are single use only and are to be thawed immediately prior to their usage. If there is any remaining volume in an aliquot, do not refreeze but discard.

Table 11: Stock of PMA (1 mg/mL) Recipe

| Ingredient | Stock Concentration | Final Concentration | Amount for 1 mL | Vendor/Catalog |
|---------------------------|---------------------|---------------------|-----------------|-------------------------------|
| PMA (lyophilized powder)* | 1 mg | 1 mg/mL | | Sigma-Aldrich/ P8139-1MG |
| DMSO (sterile) | N/A | N/A | 1 mL** | Sigma-Aldrich/ D8418-50 ML |

*Spin PMA tube in a mini centrifuge for 10 seconds to collect the contents at the bottom of the tube.

** Add DMSO to PMA tube. Pipette mix up & down slowly to mix PMA fully into solution.

Table 12: Working Stock of PMA (100 µg/mL) Recipe

| Ingredient | Stock Concentration | Final Concentration | Amount for 1 mL | Vendor/Catalog |
|--|---------------------|---------------------|-----------------|-----------------------------|
| PMA (from Table 11; 1 mg/mL) | 1 mg/mL | 100 µg/mL | 100 µL* | Sigma-Aldrich/ P8139-1MG |
| Phosphate Buffered Saline (1XPBS) without Calcium or Magnesium | 1X | 1X | 900 µL | Gibco/10010072 |

* Ensure PMA master stock (1 mg/mL) is fully in solution and well mixed before pipetting.

- **CRITICAL:** Prepare 25 µL PMA working stock aliquots (PMA diluted in 1X PBS) and freeze at -20°C for no longer than 1 month. Aliquots are single use only and are to be thawed immediately prior to their usage. If there is any remaining volume in an aliquot, do not refreeze but discard.

C. Protocol

Chapter 1: Getting Started

Kit Contents

IsoLight IsoCode Reagent Box (4°C)

15 mL Tube A

15 mL Tube B

1.5 mL Tube A/B: Cocktail A in Micro-Tube (Green Cap) and Cocktail B in Micro-Tube (Red Cap)

50 mL Tubes Containing Reagents 1, 2, 3, 4, 5, 6, 7, 8

1 Bag of Disposable Reagent Sippers

IsoSpark IsoCode Reagent Box (4°C)

15 mL Tube A

15 mL Tube B

1.5 mL Tubes A/B: Cocktail A in Micro-Tube (Green Cap) and Cocktail B in Micro-Tube (Red Cap)

Cartridge containing Reagents 1, 2, 3, and 4

IsoCode Chip Set (-20°C)

Boxes of IsoCode Chips (2 Per Box)

IsoSpark: 4 chip kits

IsoLight: 4 or 8 chip kits

Cell Stain 405 [ordered separately]

Cell Stain 405 Diluent (DMSO) [part of cell stain 405 kit]

Chapter 2: Recovery of Cryopreserved Cells

Materials Required

Complete RPMI (37°C)
2-Mercaptoethanol (4°C)
Recombinant IL-2 at 1 µg/mL (-20°C)
Cryopreserved Mouse Cells
15 mL Centrifuge Tube
Plate and/or Flask
For > 10 M cells, T75 Flask
For 6 - 9.9 M cells, T25 Flask
For < 6 M, 6 Well Plate

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

1. Prepare complete RPMI supplemented with 55 µM of 2-Mercaptoethanol.

- a. Dilute 50 μL of 55 mM 2-Mercaptoethanol into 50 mL of complete RPMI.
- b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
2. Pipette 5 mL of complete RPMI/2-Mercaptoethanol into a 15 mL centrifuge tube, labeled *Thawed Mouse Cells*.
- 3. Using proper PPE, remove cells from liquid nitrogen storage and thaw cells. **TIP: Be careful of contamination.**
4. Quickly move vials into a water bath (37°C) to thaw. While thawing, swirl the vial in the water until a single ice crystal remains in the vial. Be sure to prevent (to the best of your ability) any of the water from the water bath from getting under the cap and into the sample.
5. When the sample is nearly thawed, remove the vial and immediately spray vial with 70% alcohol before bringing into the hood. It is important to allow the alcohol to evaporate before opening the vial.
- 6. Slowly pipette thawed cells into 5 mL of complete RPMI/2-Mercaptoethanol in 15 mL centrifuge tube, labeled *Thawed Mouse Cells*. **TIP: Insert tip into complete RPMI when pipetting, be careful to not create bubbles.**
- 7. Take 1 mL of complete RPMI/2-Mercaptoethanol and pipette into original thawed cell vial. Rinse inside the vial with the complete RPMI/2-Mercaptoethanol to recover additional thawed cells. **TIP: Insert tip into complete RPMI, be careful to not create bubbles.**
- 8. Draw up cell/complete RPMI/2-Mercaptoethanol mixture and pipette into the 15 mL centrifuge tube, labeled *Thawed Mouse Cells*. **TIP: Insert tip into complete RPMI and pipette gently up and down. Be careful to not create bubbles.**
9. Centrifuge cells for 10 minutes at 300 rcf.
10. While the cells are centrifuging, take the IL-2 (1 $\mu\text{g}/\text{mL}$) out from -20°C and thaw at room temperature.
- **CRITICAL: Use IL-2 aliquot that has been frozen at -20°C for less than a month. Do not use IL-2 that has been previously thawed.**
11. After cells are centrifuged, check for cell pellet.
- 12. Aspirate supernatant. **TIP: Be careful not to aspirate cell pellet.**
 - a. Use pipette to remove last bit of supernatant.
13. Resuspend cell pellet in 1 mL of fresh complete RPMI/2-Mercaptoethanol.
- a. Mix well to resuspend. **TIP: Make sure to pipette around the tube to ensure there are no clumps or bubbles.**
14. Slowly add additional complete RPMI/2-Mercaptoethanol to a final concentration of 1×10^6 cells/mL.
15. Mix thawed IL-2 thoroughly by carefully pipetting up and down.
16. Dilute 100 μL of 1 $\mu\text{g}/\text{mL}$ IL-2 per 10 mL of cell suspension to a final concentration of 10 ng/mL IL-2.
- **CRITICAL: Discard thawed IL-2 aliquot if there is any volume remaining. IL-2 must only be thawed once.**

- 17. Mix with serological pipette. **TIP: Gently pipet up and down 3-5 times, be careful to not create bubbles.**
- 18. Transfer cell suspension to flask or plate. **TIP: Slowly pipette down the side of the flask as to not create bubbles.**
- 19. Spread out cell suspension by rocking flask or plate carefully to fully cover the bottom of the container. **TIP: Be careful to not make bubbles.**
- 20. Move to incubator for overnight recovery at 37°C, 5% CO₂. **NOTE: The time period for overnight recovery is considered 16 – 20 hours, but not exceeding 24 hours.**

Chapter 3: Post-Recovery Sample Setup

Materials Required

Complete RPMI (37°C)
2-Mercaptoethanol (4°C)
15 mL Centrifuge Tube
Overnight Recovered Cells from Chapter 2 or Fresh
Mouse Cells if Working with Fresh Samples
Lo-Bind Microcentrifuge Tube for Cell Count

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

1. Prepare complete RPMI supplemented with 55 µM of 2-Mercaptoethanol.
 - a. Dilute 50 µL of 55 mM 2-Mercaptoethanol into 50 mL of complete RPMI.
 - b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
2. Transfer cells from flask or plate into 15 mL centrifuge tube.
- 3. Add complete RPMI/2-Mercaptoethanol to flask or plate and rinse 5 times. **TIP: Make sure to spread out the complete RPMI to gather maximum number of cells.**
 - For T75 Flask add 3 mL
 - For T25 Flask add 2 mL
 - For 6 Well Plate add 1 mL
4. Transfer cell/complete RPMI/2-Mercaptoethanol mixture to the 15 mL centrifuge tube.
- 5. Mix well 5 times with 10 mL serological pipette. **TIP: Be careful not to create bubbles.**
- 6. Take a 10 µL aliquot of your cells and transfer to a Lo-Bind Microcentrifuge Tube for cell counting. **CRITICAL: See Appendix D1 for cell counting instructions.**
- 7. Centrifuge cells for 10 minutes at 300 rcf. While cells are centrifuging, use hemocytometer to count cells. **CRITICAL: See Appendix D1 for cell counting instructions.**

- **CRITICAL:** If cells are less than 80% viable, proceed to Appendix D2 Protocol: Dead Cell Removal Using Ficoll.
8. Proceed immediately to next chapter.

Chapter 4: CD8 Sample Enrichment

Materials Required

Complete RPMI (37°C)
 2-Mercaptoethanol (4°C)
 RoboSep Buffer (4°C)
 Miltenyi CD8a (Ly-2) Microbeads, Mouse, 2 mL (4°C)
 MACS LS Column
 Prepared Cells from Chapter 3
 Enrichment Kit:
 MACS Metal Plate/Magnet Kit
 3 x 15 mL Centrifuge Tubes (*Discard, Flow Through, CD8 fraction*)
 Lo-Bind Microcentrifuge Tube for Post-Enrichment CD8

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

1. Remove the centrifuged cells and check for cell pellet.
- 2. Aspirate supernatant. **TIP: Be careful not to aspirate the cells.**
 - a. Use pipette to aspirate remaining supernatant.
- **CRITICAL:** For every 1×10^7 cells, resuspend in 90 μL RoboSep (4°C) and 10 μL of CD8 beads (4°C).
3. Add 90 μL of cold RoboSep to 15 mL centrifuge tube containing 1×10^7 or fewer cells.
4. Vortex the Miltenyi CD8a (Ly-2) Microbeads at a slow speed for 10 seconds.
5. Add 10 μL of Miltenyi CD8a (Ly-2) Microbeads to the cell suspension in RoboSep (containing 1×10^7 or fewer cells) and mix well by gently pipetting up and down 5 times.
- **TIP: Make sure to eliminate clumps so that beads are evenly distributed among cells. Be careful not to create bubbles.**
- 6. Incubate in refrigerator (4°C) for 10 minutes. **TIP: Don't incubate on ice as increased incubation times may be required.**
- 7. Set up MACS sorting by setting metal plate in tissue culture hood and placing magnet on metal plate. Place LS column in magnet with wings facing out and align the 15 mL centrifuge tube labeled "Discard" under the LS column. **CRITICAL: LS Column should not touch the tubes.**
8. After incubating for 10 minutes, for 1×10^7 cells or fewer, add 400 μL of cold RoboSep to the 15 mL tube to bring up volume to 500 μL .

- a. Mix well to resuspend by gently pipetting up and down 5 times. **TIP: Make sure to pipette around the tube to ensure there are no clumps or bubbles.**
- **TIP: Keep RoboSep in refrigerator during enrichment process.**
- **CRITICAL: Be careful not to let column dry out. Do not add liquid when there is already liquid in the LS Column.**
- 9. Start with the LS column over the "Discard" tube, add 3 mL of cold RoboSep to LS Column. **CRITICAL: Be careful not to create bubbles or touch sides of LS column. Let all the RoboSep flow through before moving on to the next step. As a reminder, be careful to not let the column dry out.**
- 10. Unscrew and keep cap for "Flow Through" tube. **NOTE: This is in preparation for next step to ensure the column does not dry out during the transition.**
- 11. When the last drop falls through to the "Discard" tube, move the rack over so the LS column is over the "Flow Through" tube. **CRITICAL: Be careful not to let column dry. If there is one drop remaining that will not fall, move on to the next step.**
- 12. Increase volume of pipette to 800 μ L to ensure all 500 μ L of the cell suspension is drawn up.
- 13. Mix cell suspension by gently pipetting up and down 5 times. **NOTE: This ensures that the cells are evenly dispersed after sitting.**
- 14. Draw up all 500 μ L of cell suspension and pipette carefully into the center of the LS column without touching sides of the column.
- 15. Wash LS column with 3 mL of cold RoboSep.
 - a. Rinse inside walls of cell suspension tube with 3 mL of cold RoboSep before transferring the mixture to LS Column. **NOTE: This is to retrieve any cells that have been left behind.**
- i. Pipette all the mixture into LS Column after last drop passes through or does not fall from step 14. **CRITICAL: Be careful not to let LS Column dry out or allow pipette to touch sides.**
- 16. After the last drop of the wash passes through or does not fall, remove the LS Column carefully from the magnet, and place carefully on the tube labeled for "CD8 fraction."
- 17. Cap the "Flow Through" tube, this will be used for the CD4 enrichment. **Do not discard.**
- 18. Add 5 mL of cold RoboSep to the LS column. **CRITICAL: Be careful not to touch the sides.**
- 19. Take plunger, smoothly push down on the plunger to push the RoboSep buffer through the LS Column. **TIP: Lift up at the end of the plunging action so that the liquid does not splash back onto the LS Column tip.**
- 20. Set LS Column back on the "CD8 fraction" tube.
- **CRITICAL: Do not allow the plunger to interact with external contaminants. It will be used for one more step.**
- 21. Loosen up plunger. Remove plunger briefly from column and hold in one hand.
- 22. Add another 2 mL of cold RoboSep to the LS Column.
- 23. Take plunger, smoothly push down on the plunger to push the RoboSep buffer through the LS Column. **TIP: Lift up at the end of the plunging action so that the liquid does not splash back onto the LS Column tip.**
- 24. Discard LS Column and plunger.

25. Centrifuge “CD8 fraction” tube and “Flow Through” (CD8 Depleted Cell Fraction) tube for 10 minutes at 300 rcf.
26. Prepare complete RPMI supplemented with 55 μ M of 2-Mercaptoethanol.
 - a. Dilute 5 μ L of 55 mM 2-Mercaptoethanol into 5 mL of complete RPMI.
 - b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
27. After cells are centrifuged, check for cell pellets.
- 28. Aspirate RoboSep buffer from “CD8 fraction” and “Flow Through” (CD8 Depleted Cell Fraction) tubes. **TIP: Be careful to not aspirate cell pellet.**
29. Use pipette to aspirate the remaining supernatant from each tube. **TIP: Be careful to not aspirate cell pellet.**
- 30. Add 1 mL complete RPMI/2-Mercaptoethanol to “CD8 fraction” and resuspend cell pellet. **TIP: Make sure there are no clumps or bubbles.**
31. Add an additional 1 mL of complete RPMI/2-Mercaptoethanol and mix thoroughly by gently pipetting up and down 5 times. **TIP: Make sure there are no clumps or bubbles.**
- 32. Aliquot 10 μ L of the “CD8 fraction” into a Lo-Bind Microcentrifuge tube and proceed to cell count. **CRITICAL: See Appendix D1 for cell counting instructions.**
33. Move “CD8 fraction” tube to incubator until Cell Stimulation (Chapter 6).

Chapter 5: CD4 Sample Enrichment

Materials Required

Complete RPMI (37°C)
 2-Mercaptoethanol (4°C)
 RoboSep Buffer (4°C)
 Miltenyi CD4 (L3T4) Microbeads, Mouse, 2 mL (4°C)
 MACS LS Column
 CD8 Depleted Fraction or Overnight Recovered Cells from Chapter 3 if CD8 Depletion is Not Necessary
 Enrichment Kit:
 MACS Metal Plate/Magnet Kit
 3 x 15 mL Centrifuge Tubes (*Discard, Flow Through, CD4 fraction*)
 Lo-Bind Microcentrifuge Tube for Post-Enrichment CD4

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

- **CRITICAL: For every 1×10^7 cells, resuspend in 90 μ L RoboSep (4°C) and 10 μ L of CD4 (L3T4) beads (4°C).**

1. Add 90 μL of cold RoboSep to 15 mL centrifuge tube containing CD8 depleted fraction of 1×10^7 or fewer cells.
2. Vortex the Miltenyi CD4 (L3T4) Microbeads at a slow speed for 10 seconds.
3. Add 10 μL of Miltenyi CD4 (L3T4) Microbeads to the cell suspension in RoboSep (containing 1×10^7 or fewer cells) and mix well by gently pipetting up and down 5 times.
 - **TIP: Make sure to eliminate clumps so that beads are evenly distributed among cells. Be careful not to create bubbles.**
- 4. Incubate in refrigerator (4°C) for 10 minutes. **TIP: Don't incubate on ice as increased incubation times may be required.**
- 5. Set up MACS sorting by setting metal plate in tissue culture hood and placing magnet on metal plate. Place LS column in magnet with wings facing out and align the 15 mL centrifuge tube labeled "Discard" under the LS column. **CRITICAL: LS Column should not touch the tubes.**
6. After 10 minutes, for 1×10^7 cells or fewer, add 400 μL of cold RoboSep to the 15 mL tube to bring up volume to 500 μL .
 - a. Mix well to resuspend by gently pipetting up and down 5 times. **TIP: Make sure to pipette around the tube to ensure there are no clumps or bubbles.**
 - **TIP: Keep RoboSep in refrigerator during enrichment process.**
 - **CRITICAL: Be careful not to let column dry out. Do not add liquid when there is already liquid in the LS Column.**
- 7. Start with the LS column over the "Discard" tube, add 3 mL of cold RoboSep to LS Column. **CRITICAL: Be careful not to create bubbles or touch sides of LS column. Let all the RoboSep flow through before moving on to next step. As a reminder, be careful to not let the column dry out.**
8. Unscrew and keep cap for "Flow Through" tube. **NOTE: This is in preparation for next step to ensure the column does not dry out during the transition.**
- 9. When last drop falls through to "Discard" tube, move the rack over so the LS column is over the "Flow Through" tube. **CRITICAL: Be careful not to let column dry. If there is one drop remaining that will not fall, move on to the next step.**
10. Increase volume of pipette to 800 μL to ensure all 500 μL of the cell suspension is drawn up.
11. Mix cell suspension by gently pipetting up and down 5 times. **NOTE: This ensures that the cells are evenly dispersed after sitting.**
12. Draw up all 500 μL of cell suspension and pipette carefully into the center of the LS column without touching sides of the column.
13. Wash LS column with 3 mL of cold RoboSep.
 - a. Rinse inside walls of cell suspension tube with 3 mL of RoboSep before transferring the mixture to LS Column. **NOTE: This is to retrieve any cells that have been left behind.**
 - i. Pipette all of the mixture into LS Column after last drop passes through or does not fall from step 12. **CRITICAL: Be careful not to let LS Column dry out or allow pipette to touch sides.**

14. After the last drop of the wash passes through or does not fall, remove the LS Column carefully from the magnet, and place carefully on the tube labeled for "CD4 Fraction."
15. Cap the "Flow Through" tube and discard.
- 16. Add 5 mL of cold RoboSep to the LS column. **CRITICAL: Be careful not to touch the sides.**
- 17. Take plunger, smoothly push down on the plunger to push the RoboSep buffer through the LS Column. **TIP: Lift up at the end of the plunging action so that the liquid does not splash back onto the LS Column tip.**
18. Set LS Column back on the "CD4 Fraction" tube.
19. Loosen up plunger. Remove plunger briefly from column and hold in one hand.
- **CRITICAL: Do not allow the plunger to interact with external contaminants. It will be used for one more step.**
20. Add another 2 mL of cold RoboSep to the LS Column.
- 21. Take plunger, smoothly push down on the plunger to push the RoboSep buffer through the LS Column. **TIP: Lift up at the end of the plunging action so that the liquid does not splash back onto the LS Column tip.**
22. Discard LS Column and plunger.
23. Centrifuge "CD4 Fraction" tube for 10 minutes at 300 rcf.
24. Prepare complete RPMI supplemented with 55 μ M of 2-Mercaptoethanol.
 - a. Dilute 5 μ L of 55 mM 2-Mercaptoethanol into 5 mL of complete RPMI.
 - b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
25. After cells are centrifuged, check for cell pellet.
- 26. Aspirate RoboSep buffer from "CD4 fraction" tube. **TIP: Be careful to not aspirate cell pellet.**
- 27. Use pipette to aspirate the remaining supernatant from each tube. **TIP: Be careful to not aspirate cell pellet.**
- 28. Add 1 mL complete RPMI/2-Mercaptoethanol to "CD4 fraction" and resuspend cell pellet. **TIP: Make sure there are no clumps or bubbles.**
- 29. Add an additional 1 mL of complete RPMI/2-Mercaptoethanol and mix thoroughly by gently pipetting up and down 5 times. **TIP: Make sure there are no clumps or bubbles.**
- 30. Aliquot 10 μ L of the CD4 fraction into a Lo-Bind Microcentrifuge tube and proceed to cell count. **CRITICAL: See Appendix D1 for cell counting instructions.**
31. Move "CD4 fraction" tube to incubator until Cell Stimulation (Chapter 6).

Chapter 6: Cell Stimulation

Materials Required

Complete RPMI (37°C)
2-Mercaptoethanol (4°C)
PMA at 100 µg/mL (-20°C)
Ionomycin at 1 mg/mL (-20°C)
15 mL Centrifuge Tubes
96 Well Plate Flat Bottom
Lo-Bind Microcentrifuge Tubes for Cell Counting
Incubated CD8 Tube in complete RPMI
Incubated CD4 Tube in complete RPMI

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

1. Prepare complete RPMI supplemented with 55 µM of 2-Mercaptoethanol.
 - a. Dilute 15 µL of 55 mM 2-Mercaptoethanol into 15 mL of complete RPMI.
 - b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
2. Retrieve the separate PMA and Ionomycin **single use aliquots** from -20°C.
- 3. After PMA and Ionomycin **single use aliquots** are completely thawed, spin down in a mini centrifuge for 10 seconds to collect the contents at the bottom of the tubes. **TIP: Ensure that contents are all in the bottom of the vial.**
4. Prepare Complete RPMI/2-Mercaptoethanol Unstimulated media.
 - a. Aliquot 5 mL complete RPMI/2-Mercaptoethanol into a 15 mL Centrifuge Tube labeled "Complete RPMI Unstimulated" —set this complete RPMI aside as it will serve as the complete RPMI used for the **unstimulated** (negative control) condition.
- **CRITICAL: Do not add stimulants into this complete RPMI/2-Mercaptoethanol. Volume required is dependent on number of cells.**
- 5. Prepare PMA/Ionomycin stimulation complete RPMI mixture. Aliquot 10 mL complete RPMI/2-Mercaptoethanol into a 15 mL Centrifuge Tube labeled "PMA/Ionomycin Complete RPMI." The final concentration of stimulants will be **50 ng/mL PMA** and **1 µg/mL Ionomycin**. **CRITICAL: Volume required is dependent on number of cells.**
 - a. Aliquot 10 mL complete RPMI/2-Mercaptoethanol into a 15 mL Centrifuge Tube labeled "PMA/Ionomycin Complete RPMI."
 - b. Add 5 µL of PMA (aliquot stock is at 100 µg/mL) and 10 µL of Ionomycin (aliquot stock is at 1 mg/mL) to the complete RPMI/2-Mercaptoethanol.
 - c. Use serological pipette to mix thoroughly.

- **CRITICAL: Discard remaining/unused PMA and Ionomycin—they are single use only and cannot be refrozen.**
- 6. Take CD8 and CD4 cells from incubator.
- 7. Centrifuge CD8 and CD4 cells for 10 minutes at 300 rcf.
- 8. After cells are centrifuged, check for cell pellet.
- 9. Aspirate supernatant with pipette. **TIP: Make sure to use a manual pipette to prevent accidental aspiration of cell pellet.**
- 10. Using the complete RPMI set aside for the **unstimulated** condition, resuspend all the CD8 and CD4 cells with complete RPMI to a cell concentration of 1×10^6 cells/mL. **TIP: This step is for preparing the unstimulated (negative control) cells. This complete RPMI is not supplemented with any stimulants.**
- 11. Plate 100 μ L of the CD8 and CD4 **unstimulated** cells, per well, on the 96 Well Flat Bottom Plate. **TIP: Plate at least two wells on the 96 Well Flat Bottom Plate for the unstimulated condition.**
- 12. Centrifuge the remaining CD8 and CD4 cells (that will serve as the **PMA/Ionomycin stimulated** cells) for 10 minutes at 300 rcf.
- 13. After cells are centrifuged, check for cell pellet.
- 14. Aspirate supernatant with pipette. **TIP: Make sure to use a manual pipette to prevent accidental aspiration of cell pellet.**
- 15. Use a pipette to mix the PMA/Ionomycin stimulation complete RPMI mixture to ensure it is evenly distributed.
- 16. Using the PMA/Ionomycin stimulation complete RPMI mixture from step 15, resuspend CD8 cells to a cell concentration of 1×10^6 cells/mL. **CRITICAL: When resuspending, take into consideration the cells removed for the unstimulated condition. TIP: Resuspend as thoroughly as possible, but gently.**
- 17. Repeat step using CD4 cells.
- 18. Mix CD8 cells by pipetting up and down gently 5 times. Add 100 μ L of cell suspension to empty wells on the 96 Well Flat Bottom Plate. **CRITICAL: Be careful not to create bubbles. This will maximize even stimulation of cell suspension.**
- 19. Repeat step using CD4 cells.
- 20. Incubate plate for **16 hours** at 37°C, 5% CO₂.

Chapter 7: Chip Thaw

Materials Required

IsoCode Chips in Vacuum Sealed Bag (-20°C)

Methods

- 1. Take vacuum sealed bag containing IsoCode chips from -20°C. **CRITICAL: Chips must stay sealed until Chip Loading (Chapter 9).**

2. Place on bench to thaw at ambient temperature 30 - 60 minutes prior to use.
3. While chips thaw, prepare liquid reagents and attach all reagent tubes to Bruker instrument. Refer to your instrument's system guide for detailed instructions.

Chapter 8: Cell Staining

Materials Required

PMA/Ionomycin Stimulated & Unstimulated CD8 & CD4 Cells in 96 Well Plate from Chapter 6
2 x Lo-Bind Microcentrifuge Tubes (*Stain Master Mix, CD8, CD4*)
Sterile 1X PBS (Room Temperature)
Complete RPMI (37°C)
Cell Stain 405 (-20°C)
Cell Stain 405 Diluent (DMSO) (-20°C)

All the following steps should take place in a sterile tissue culture hood. Centrifugation steps should be performed at 21°C.

Methods

1. Prepare cell stain 405 stock.
 - a. Thaw tube of cell stain 405 diluent (DMSO) at room temperature.
 - b. Spin tubes of cell stain 405 and cell stain 405 diluent (DMSO) in a mini centrifuge for 10 seconds to collect the contents at the bottom of the tubes.
 - c. Add 20 μ L of cell stain 405 diluent (DMSO) directly to the tube of cell stain 405. Pipet up and down 15 times gently to resuspend.
- **CRITICAL: Cell stain 405 must be prepared fresh. Discard remaining stain – do not store.**
- 2. Prepare stain master mix by diluting 1 μ L of cell stain 405 into 1 mL of 1X PBS in a Lo-Bind microcentrifuge tube (1:1000 final dilution). With the same pipette tip, pipette up and down 10 times to ensure all cell stain 405 has been released. Depending on sample number and cell count, additional tubes of stain master mix may need to be prepared. **CRITICAL: Failure to follow these steps will negatively impact cell counts.**
 - a. With a P1000 set to 500 μ L, gently pipette the stain master mix up and down **15 times**.
 - b. **Gently vortex** the stain master mix for **5 seconds**.
 - c. **Ensure master mix is mixed well before adding stain to cells.**
3. Remove 96 well plate with CD8 and CD4 cells from incubator.
4. Mix CD8 cells by pipetting up and down. Transfer cells to a Lo-Bind microcentrifuge tube by using P100 pipette to draw up 100 μ L at a time in a gentle, circular motion until well is empty. **NOTE: Pool wells if there are replicates.**
5. Repeat step 4 using CD4 cells.

Prep, Run, Analyze

6. Centrifuge cells for 10 minutes at 300 rcf.
7. After cells are centrifuged, check for cell pellets.
- 8. Remove the majority of the supernatant with a P1000 or P200 pipette. Switch to a P10 pipette to remove all media from the cell pellet.* **TIP: Be careful not to aspirate the cell pellets.**
***NOTE: Supernatants may be stored at -80°C for bulk assay.**
9. Add 1 mL of PBS to dilute any remaining media and mix by pipetting up and down.
- **CRITICAL: Failure to remove excess media will result in poor staining.**
10. Centrifuge cells for 10 minutes at 300 rcf.
11. After cells are centrifuged, check for cell pellets.
- 12. Remove the majority of the supernatant with a P1000 or P200 pipette. Switch to a P10 pipette to remove all media from the cell pellet. **TIP: Be careful not to aspirate the cell pellets.**
13. Gently remix stain master mix.
- **CRITICAL: Failure to remix stain master mix will result in poor staining.**
- 14. For every 1×10^6 cells, add 100 μL of **well mixed** stain master mix to each cell suspension tube. **CRITICAL: Pipet to mix the cells 15 times. Be careful to not create bubbles.**
15. Incubate for 5 minutes at 37°C in the dark.
- 16. Gently pipette to mix the cell suspension **15 times**. **CRITICAL: Be careful to not create bubbles.**
17. Incubate for an additional 5 minutes at 37°C in the dark.
- 18. After incubation, add 5 times the volume of complete RPMI **without 2-Mercaptoethanol**. **CRITICAL: Pipet to mix the cells 15 times. Be careful to not create bubbles.**
19. Incubate for 10 minutes at 37°C in the dark.
- 20. Take 10 μL of cells to count. Count cells using a hemocytometer and determine percent of viable cells as described in Appendix D1. **TIP: Cell counting can be done while cells are incubating.**
21. Centrifuge stained cells for 10 minutes at 300 rcf.
22. After cells are centrifuged, check for cell pellets.
- 23. Aspirate supernatant with a pipette. **TIP: Be careful not to aspirate the cell pellets.**
- 24. Resuspend the cell pellet with complete RPMI **without 2-Mercaptoethanol** to a cell density of 1×10^6 cells/mL. Proceed to Chapter 9.
- **CRITICAL: Resuspend cells with complete RPMI ONLY. Addition of 2-Mercaptoethanol to complete RPMI may negatively impact results.**

Chapter 9: Chip Loading

Materials Required (Pre-prepared)

Pre-Thawed IsoCode Chips in Vacuum Sealed Bag from Chapter 7
Stained CD8 Cells at 1×10^6 cells/mL
Stained CD4 Cells at 1×10^6 cells/mL

Methods

1. Remove IsoCode chips from vacuum sealed bag and place on a flat surface. **CRITICAL: Keep protective blue film on bottom of chip.**
2. Resuspend CD8 fractions by gently pipetting up and down 15 times. Immediately proceed to chip loading. Pipette 30 μ L of cell suspension into IsoCode chip. **CRITICAL: Be careful not to create bubbles. Insert pipette tip vertically into inlet port until tip lightly touches bottom, and slowly pipette 30 μ L into inlet port. Be careful not to eject second step of pipette—it will cause bubbles.**
3. Resuspend CD4 fractions by gently pipetting up and down 15 times. Immediately proceed to chip loading. Pipette 30 μ L of cell suspension into IsoCode chip. **CRITICAL: Be careful not to create bubbles. Insert pipette tip vertically into inlet port until tip lightly touches bottom, and slowly pipette 30 μ L into inlet port. Be careful not to eject second step of pipette—it will cause bubbles.**
4. Let IsoCode chips sit for one minute on a flat surface.
5. Check bottom of chip to ensure liquid has entered the chip. **TIP: If liquid has not flowed, tap IsoCode chip on flat surface lightly.**
6. When inserting IsoCode chip into the instrument, make sure the logo is facing up and towards you with the magnet facing the instrument. Take the blue film off while inserting each IsoCode chip into the instrument.

NOTE: Please refer to your instrument's loading instructions for details.

D: Appendix

D1 Protocol: Cell Quantification & Viability

Materials Required

| |
|---|
| Hemocytometer 10 μ L aliquot of cells Trypan Blue |
|---|

NOTE: Automated cell counters can be used in this protocol EXCEPT prior to loading cells on chip due to spectral overlap of the stains. Manual cell counting is required prior to loading on the chip.

NOTE: To obtain an accurate representation of cell viability, cells should be counted within 15 minutes of staining as cell viability will drop over time because Trypan Blue is toxic.

1. Quick spin the Trypan Blue to pellet potential debris. Remove aliquot from the top of Trypan Blue.
- 2. Using a P10 pipette, add equal volume of Trypan blue solution to 10 μ L of sample. Mix gently to resuspend.
TIP: Make sure to pipette around the tube to ensure there are no clumps or bubbles.
- 3. Load onto hemocytometer. **CRITICAL: Be careful not to overfill or create bubbles.**
4. Count and record viable (clear) and dead cells (blue) of all four 16-square corners.
- **CRITICAL: If more than 200 cells/16 squares were counted, repeat count using a 1:5 or 1:10 dilution with 1X PBS or complete RPMI using a fresh sample aliquot.**
5. Calculate the concentration of cells as follows:
 - a. Concentration (cells/mL) = Average per square cell count x 10^4 x dilution factor
6. Calculate the number of cells as follows:
 - a. Number of cells = Cell concentration (cells/mL) from D.1.5 x total volume of cell suspension (mL)
7. Calculate percent viable cells:
 - a. % Viable cells = $100 \times \text{number of viable cells} / [\text{number of viable cells} + \text{number of dead cells}]$

D2 Protocol: Dead Cell Removal Using Ficoll

Materials Required

| |
|--|
| Complete RPMI (37°C) 2-Mercaptoethanol (4°C) Cells (Minimum 3×10^6) 2 x 15 mL Centrifuge Tubes Lo-Bind Microcentrifuge Tube(s) Ficoll Paque PREMIUM 1.084 |
|--|

- **CRITICAL: It is recommended to start this protocol with a minimum of 3×10^6 total cells.**
1. Carefully add 6 mL of Ficoll to the bottom of the required number of 15 mL centrifuge tube(s) prior to harvesting stimulation cultures.

Prep, Run, Analyze

2. Centrifuge cells for 10 minutes at 300 rcf.
3. Remove cells from centrifuge, check for cell pellet.
- 4. Aspirate supernatant. **TIP: Be careful not to aspirate cell pellet.**
 - a. Use pipette to aspirate remaining supernatant.
- 5. Resuspend the pellet(s) in 7 mL of complete RPMI. **TIP: Be careful not to create bubbles.**
 - **CRITICAL: Do not use more than 1×10^7 cells of your suspension per Ficoll tube.**
- 6. Add the cell suspension(s) VERY SLOWLY to the tube(s) containing Ficoll. **CRITICAL: Place the tip of your pipette on the wall of the tube, close to the Ficoll layer. Add cell suspension VERY SLOWLY.**
- **CRITICAL: This step must be done carefully and slowly to avoid mixing of the layers.**
7. Centrifuge tubes for 20 minutes at 300 rcf without brake or acceleration.
- **CRITICAL: Turn acceleration and brakes off to preserve the density layers established during centrifugation.**
8. Prepare complete RPMI supplemented with 55 μ M of 2-Mercaptoethanol.
 - a. Dilute 6 μ L of 55 mM 2-Mercaptoethanol into 6 mL of complete RPMI.
 - b. Use serological pipette to mix thoroughly.
- **CRITICAL: 2-Mercaptoethanol should only be added to media right before use. Discard any unused media.**
9. While cells centrifuge, prepare appropriate number of 15 mL centrifuge tube(s) containing 6 mL of complete RPMI/2-Mercaptoethanol.
10. Remove cells from centrifuge, check for cloudy layer which are the viable cells.
- 11. Aspirate a small volume of the supernatant. **CRITICAL: Be careful not to aspirate cloudy layer containing viable cells.**
12. Using a P1000 pipette, collect the viable cells by recovering the cloudy layer between Ficoll and complete RPMI media.
13. Transfer cells into the 15 mL centrifuge tube(s) containing complete RPMI.
- 14. Aliquot 10 μ L of cell/complete RPMI mixture(s) into a Lo-Bind Microcentrifuge Tube(s) and proceed to cell count. **CRITICAL: See Appendix D1 for cell counting instructions.**

Troubleshooting & References
