

Secure and remote patient monitoring

Mjog's remote monitoring tools help gather patient information easily and securely - coding back to the patient record - helping you meet QOF targets and plan workload better, all-year round.

Efficient patient management

Completing long review templates can be time consuming and make appointments disjointed. So we designed an efficient solution to support the management of long-term conditions: Patient Questionnaires.

Our Patient Questionnaires allow practices to send a message to the patient containing a web-based link to a questionnaire. Once the patient submits the response back to the practice, it can be reviewed and automatically coded to the patient's medical record.

Why are Patient Questionnaires important?

From Asthma to Depression, our Patient Questionnaires enable practices to easily get structured information from specific patient groups, without making phone calls, sending letters, or inefficient appointments.

Patient Questionnaires can make the QOF process more efficient for practices, so you spend less time chasing patients by telephone and manually coding patient responses. That's not all - **Mjog's new ethnicity questionnaire has returned a 5% increase in response rate.**
